

I like the way of teaching. In class no boring is there. Along with programming other general talks about the IT oriented subjects is interesting and informative to us. It is the only hour that breaks the continuous teaching and getting relief from that. And about teaching my suggestion is my request is that I am not clear about the way of explaining the program. So please consider it.

Sir, first of all I have to say you are a good teacher. your teaching style entirely different from all other teachers that I met in my life. Like the subject C programming it's a good way to. because I know most of all students even me don't have a logic to write atleast one program. This is mainly because we came from the background is like that. In that time in my case I never think about the logic, I just copied the program from the board & lab I executed it. Now it is little bit easy because we are ready to think the logic. but the one unwanted thing is like we were very lazy to think. May be the workings of programs in class is give a little bit change.

I like your classes because it's very easy teaching way as well as easy to predict also.

Hi Om Sir,

According to my opinion, the way you take good. The small small tips and suggestions that you our class is interesting and beneficial. Sharing your with you is so interesting. The best thing I in your class is the way you explain program step by step explanation of programs makes to think about program logic instead of by the programs which I have done so far in other classes earlier classes. The series test that have given makes me stuck but it teaches know about different small things to remove (program). Your class makes me to think ways a program can be developed.

One suggestion is that about the 3 hours lab make me bound to do prog will be better to have a ~~time~~ to 2 lab continuously. 3 hours to

Hari Om Sir,

According to me, as a teacher you are perfect, some of the suggestions I would like to say is that, your class is too slow, so sometimes mostly afternoon classes we feel sleepy. Some of your experiences you shared with us makes the class interesting. By getting the question paper, we all began to write the output of the answer, did not even noticed a single semi colon. So from that experience you made us learn that we should read our question paper more carefully, should view ^{have} ~~two~~ points different points of view etc. From our degree colleges according to me, ~~we~~ ~~not~~ we used to byheart the programs, i think even my friends are like that, but now we began to think, so that can do small some small programs alone, i think the ~~the~~ our logic will surely increase if you guided us in the same manner as now. Some of my friends including me are afraid of you dont know why it is so. Still now the problem is not having program logic. From our degree college we didnt get any base but now we know something not everything, a few. Thank you Sir for your guidance.
